Art Unit: 2819

1. Claims 4,8 and 9 are allowed.
2. The following is an examiner's statement of reasons for allowance: a current output DA converter circuit comprising: a current output circuit, a voltage source, a data input portion and an output portion characterized in that digital data is inputted to the data input portion and a constant voltage is applied from the voltage source to the output portion in the case where the data in the data input portion takes a predetermined value and a current corresponding to a value of the data in the data input portion is applied from the current output circuit to the output portion in other cases, the current output circuit includes a plurality of drive transistors, and each gate electrode of the plural drive transistors is electrically connected to each other and a switch is provided between the gate electrode and each drain electrode of the plural drive transistors, has not been shown in the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Koyama, et al disclose a D/A converter, which generates an analog output current that is in response to the level of input digital data and outputs it from an output side by connecting each of output currents of a plurality of constant current circuits either to said output side or to a non-output side, in response to said

input digital data, wherein: said D/A converter performs feedback control, for values of said output currents for said constant current circuits, based on an analog output current at said non-output side during a period when said output currents of all of said constant current circuits are connected to said non-output sides.
